

Enviolyte Neutral Anolyte Biocide Cure for Pityriasis Rosea Disease

Pig infected with Pityriasis Rosea Disease -- before treatment began with Enviolyte Neutral Anolyte Biocide.

The efficacy of Enviolyte Neutral Anolyte Biocide is shown in the above photography from an OmniLyte Enviro Inc customer who dipped the pig in a container of Neutral Anolyte and provided Pure Neutral Anolyte as drinking water.

In just 1 week, the results shown in the photo were achieved.

Prior to the pig farmer purchasing an Enviolyte Commercial Water Electrolyzer from OmniLyte Enviro Inc with which to produce Neutral Anolyte Biocide, all the pigs infected with Pityriasis Rosea Disease had to be destroyed.

The primary killing power in Enviolyte Neutral Anolyte Biocide is the Free Available Chlorine.

Due to the inherent characteristics of Enviolyte Electro-Chemical Activation technology, the process of destroying Bacteria, Viruses, Spores, Fungi and Other Micro-Organisms is much faster and effective than with conventional chemical biocides.

The use of chemical biocides often becomes ineffective with micro-organisms that survive treatment and become resistant to the disinfectant.

In contrary manner, micro-organisms do not become resistant to Enviolyte Neutral Anolyte due to physical collapse and total oxidation destruction of the microbial cell and its DNA structure.

When properly stored, Neutral Anolyte remains Sporicidal for up to 6 months and up to 12 months as a Biocide.
